**PROCEDIMIENTOS PARA LA MEDICION DE LAS PARCELAS DE CARBONO**
**setiembre de 2015**

**1. Formularios**. Los datos en los formularios estarán ordenados por subparcelas, todos los árboles (y tallos de árboles MUL) de cada subparcela de 10 x 10 metros deben encontrarse juntos.

**2. Orden de hacer las parcelas**: Se mesclarán las parcelas de Loma, Pendiente, y Aluvión para repartirlas bién en el tiempo. Se seguirá la secuencia usada en 2015 lo más cerca posible.

**3. Calibración de la cinta diamétrica**. Antes de comenzar cada parcela se debe calibrar la cinta diamétrica por la manera siguiente. Usando una regla metálica de un metro, miden la longitud de la cinta en el punto donde marca 300 mm diámetro. La cinta debe medir 942, 943, o 944. Si mide menos de 942 o más de 945 se botará y se usará una nueva cinta. **Para cada parcela se escribirá la longitud de la cinta antes de comenzar la parcela arriba de la primera línea de datos en Página 1.**

**4. Revisión de los árboles indicados en los formularios.**

a. Hay que revisar todas las subparcelas, incluyendo las que no tienen árboles marcadas, para buscar individuos que han llegado a ≥10 cm diámetro, y también asegurar que el mapeo está correcto. Si después de revisar una subparcela se encuentra que no tiene nada nuevo, se usará el espacio de Comentarios de un árbol conveniente y se apuntará: "10-20: nada", para dejar constancia que esa subparcela fue revisada. **Para cada árbol nuevo en 2015, consultar la lista de especies de CARBONO (documento que se imprime en papel impermeable para llevar al campo con los formularios y protocolos), y TOMAR MUCHO CUIDADO que se escoja el código de géneroespecie correcto, deletreado correctamente.**

b. Antes de medir los individuos en una subparcela, se revisarán sus datos de número de subparcela y brevemente su identificación de tipo (o sea, si es un árbol, palmera, o liana), y también su ubicación dentro de la subparcela.

c. Se asegurará que no haya ningún árbol que es ≥ 10 cm de diámetro que está dentro de la subparcela pero que no está mapeado y etiquetado. Si se encuentra uno, se lo dará el último número de la serie que corresponde a esa parcela. Para estos individuos hay que identificarlos. Si no se puede identificar con certeza, se debe recolectar una muestra y escribir su número de muestreo en el espacio para comentarios. Para estos nuevos también hay que mapearlos y escribir su forma (árbol, palmera, liana) en el formulario.

**d. ANTES DE IR AL CAMPO para hacer una parcela en el censo,** revisar el documento "**Próxima lata y correcciones para hacer en censo CARBONO 2015, por parcela**", revisar las latas para asegurar el próximo número es correcto, y poner una estrella en los formularios para los árboles/tallos que requieren atención especial. Asegurar que lleven una copia de ese documento en papel impermeable.

**5. Medición de diámetro de árboles vivos.**

a. En este proyecto se usarán básicamente las mismas técnicas y códigos de datos que se están empleando en el proyecto TREES. Se medirán todos los árboles y lianas con diámetros ≥ 10 cm medidas con una cinta diamétrica EN EL PUNTO DE MEDICION. No se medirán hemiepífitas pegadas a los troncos de árboles. Se marcará el sitio exacto de la medición con un clavo 10 cm arriba de este punto (o sea, se mide a 10 cm debajo del clavo). Los datos de diámetro se anotarán en milímetros. También se notará un código (ALTMED14) describiendo dónde fue medido: 130M (punto de medición a 130 cm y medido 10 cm adajo de un clavo), 1000 (más alto que 130 cm pero menos de una escalera, medido 10 cm debajo del

clavo que lleva la etiqueta), 300 (10 cm debajo de un clavo situado a 3 m o 1 escalera), 1300 (10 cm debajo de un clavo situado a 3 m del suelo con una escalera en cada lado), 600 (6 m, con 2 escaleras), 900 (3 escaleras), 1200 (4 escaleras, lo máximo), 1600 (2 escaleras cada lado). **OJO: si el árbol está "muerto revisar", se pondrá REV en el renglón de ALTMED14. "Muerto revisar" quiere decir que se piensa que el árbol está muerto (por las características descritas abajo), pero no es seguro, entonces hay que revisar en el próximo censo.**

b. Árboles grandes y/o con formas irregulares hasta 6 m (2 escaleras). Se medirán todos los árboles, incluyendo los feos y grandes. Siempre se usará la menor altura posible para medir el diámetro de tal forma que el punto de medición no sea muy irregular o dañado. Si es necesario trabajar a 3 o 4 escaleras, se usarán un harnés de seguridad y unos mecates para amarrar las escaleras. Si el árbol continúa feo para medir a 4 escaleras, no obstante se medirá allá y se notará en el formulario que el árbol tiene mala forma en el punto de medición.

c. Para árboles que tienen más de un tronco ≥10 cm diámetro a la altura del pecho, se medirá cada tallo. El número en la placa de estos individuos debe ser primero los números del árbol seguido por el número de cada tallo. Así que un árbol 83 con 2 tallos seria tendría 2 latas, 8301 y 8302. Para cada individuo con tallos múltiples en 2015, en los formularios de campo para el censo 2015 hay un renglón para c/u de esos tallos. Hay que apuntar el **diámetro14** y el **altmed14** en el formulario para c/u de los tallos de estos individuos que son ≥10 cm diámetro.

d. Para árboles donde se cambia el punto de medición en 2015, hay que medir y apuntar en las hojas el diámetro en el viejo punto y el diámetro en el nuevo punto, y describir el nuevo punto de medición claramente en un comentario bien marcado.

e. Se debe ir cuidando de cambiar el punto de medición antes de que salga una medición afectada (o sea prever los problemas potenciales y evitarlos).

**6. Como se tomarán los datos.**

A. 1) Cuando se llega a un árbol, la person midiendo dirá en alta voz el número del árbol. 2) La persona escribiendo buscará ese número de árbol, y lo repetirá en alta voz. 3) La persona midiendo, todavía con la etiqueta del árbol en la mano, confirmará si o no.

B. La secuencía de tomar los datos de diámetro será así: 1) la persona midiendo mide el árbol y dice el dato; 2) la persona escribiendo escribe el dato, y después lo lee en alta voz; 3) la persona midiendo revisa el dato, prestando atención particular a la posición del 0 y 5 en la cinta, y confirma sí o no en alta voz. 4) La persona escribiendo compara el diámetro y la altura medida con los valores del año anterior para asegurar que son razonables. Si no, pide remedición.

**7. Medición de árboles muertos de pié**. Se medirán los diámetros todos los años de todos los árboles muertos de pie (que ya deben ser etiquetados y mapeados). Los únicos árboles muertos que no se incluirán son las palmeras ya totalmente huecas y por caerse. Se medirán las alturas de los árboles muertos usando el altímetro de láser. Estas alturas se deben medir en el momento de medir el diámetro, no en otro día. Esto quiere decir que hay que llevar El Diablo cada día. **Se debe medir hasta la terminación del tronco, sin tomar en cuenta cualquier rama.**

Una señal que un árbol está muerto es que no tiene hojas. No obstante, hay varias especies de árboles en La Selva que durante períodos pierden sus hojas naturalmente. Entonces hay que investigar cada árbol que está sin hojas vivas. Otras señales de un árbol muerto son:

- cáscara ausente o cayendo
- insectos barrenadores presentes, con aserrín amontonado al pie del árbol.

- Otra prueba es de rayar la cáscara del árbol con el gancho de la cinta día métrica. Madera sana suele ser mojada en un árbol vivo, pero seco en uno muerto.

Se notarán estas características en el formulario. Se medirá el diámetro para estos árboles muertos exactamente como para los sanos. Para los individuos muertos de pie, se notará el diámetro sumado a la cantidad 9000. Entonces, si el árbol muerto mide 267 mm, en el formulario se apunta: 9267 (que es la suma de 9000+267). Otro ejemplo, si el árbol muerto de pie mide 1017 mm, se apunta 10017 (9000+1017 = 10017). Escribiendo el diámetro así entonces nos indica que este individuo está muerto y de pie, solo individuos muertos van a tener diámetros más grandes que 9000. En el archivo de los datos, siempre se incluyen los datos para árboles muertos también, usando este código del 9000. Cuando un árbol va desde vivo a muerto de pie, hay que describir todo que se puede de la causa de la mortalidad en ese momento, y del estado actual del árbol.

Para los árboles muertos caídos en el momento del censo, se usarán los códigos de muerte como en TREES:

| | |
|---|---|
| Muerto causa desconocida | 9003 |
| Muerto aplastado | 9004 |
| Muerto posiblemente aplastado: | 9005 |
| Muerto otra causa: | 9006. |

Se debe apuntar lo máximo que se puede sobre las circunstancias de cada muerte, usando la sección de COMENTARIOS y el envés de las hojas de campo.

Noten que de ahora en adelante el diámetro en el año que un árbol muere muerto de pie debe ser su diámetro+9000, no su código de muerte.

**8. Calibración**. Se harán unas mediciones de calibración antes de comenzar el censo general y poner los datos en el archivo Calibracion 2015.xls. Idealmente se esperará por los menos un día y se remedirán los mismos árboles, pero puede ser que sean días consecutivos. Favor de medir todos los árboles posibles en un dia, o sea usar el dia completo para tomar datos en el campo, se los pueden ingresar en la computadora más tardes.

**9. Archivo de datos**. Habrá un nuevo sistema de entrar datos en 2015, esto se describirá en un documento aparte.

**10. La parcela de los 10 – 99 mm.** Este protocolo está descrito por separado.
