Received 25-V-2001. Corrected 11-XII-2001. Accepted 15-V-2002.

Abstract: In *Elaphoglossum* sect. *Polytrichia* subsect. *Hybrida* six new species are described: *E. angustioblongum* A. Rojas, *E. baquianorum* A. Rojas, *E. cotoi* A. Rojas, *E. jinoteganum* A. Rojas, *E. neeanum* A. Rojas and *E. silencioanum* A. Rojas. New combination is made for *Elaphoglossum mexicanum* (E. Fourn.) A. Rojas. Two species are reported: *E. barbatum* (H. Karst.) Hieron. and *E. scolopendrifolium* (Raddi) J. Sm. Two species are redefined: *E. erinaceum* (Fée) T. Moore and *E. tambillense* (Hook.) T. Moore. *E. pallidum* (Baker ex Jenman) C. Chr. is eliminated for Mexico and Central America. Of the new species only *E. neeanum* is present outside of the region. A key is given to those species in Mexico and Central America.

Key words: *Elaphoglossum*, new species, sect. *Polytrichia*, subsect. *Hybrida*, Elaphoglossaceae, Mexico, Central America.

This paper features some taxonomic contributions for *Elaphoglossum* section *Polytrichia* subsection *Hybrida* (Elaphoglossaceae) in Mexico and Central America. The section *Hybrida* is characterized by subulate and unrolled blade scales and hydathodes absent, and the subsection *Hybrida* is characterized principally by blackish blade scales (or absent) and present on costa and blade margin. In Flora Mesoamerica treatments have been mentioned six species for the region of the subsection: *E. albomarginatum*, *E. bachouseanum*, *E. erinaceum*, *E. pallidiforme*, *E. pallidum* and *E. tambillense*, however in the key of Mickel (1995) put to *E. albomarginatum* and *E. pallidiforme* as related with section *Elaphoglossum* subsection *Pachyglossa*, probably because have glabrous blade. A. Rojas (1996a) report to *E. denudatum* for Costa Rica and A. Rojas (1996b) describe as new species to *E. gomezianum* that was determinate as *E. pallidum*.

In the *Hybrida* group *Elaphoglossum erinaceum* (Fée) T. Moore complex is mentioned as difficult because is very variable in blade shape and size, rhizome scale size and color and habitat as is mentioned in Mickel 1991a, 1992b, 1995, Mickel and Beitel 1988.

Several species has been segregated of this complex, for example: *Elaphoglossum albomarginatum* (Smith 1975), *E. crispatum* var. *crispatum* and var. *beitelii* (Mickel 1987); *E. polyblepharum* and *E. heteroglossum* (Mickel 1991b); *E. pallidiforme* (Mickel 1992a), *E. gomezianum* (Rojas 1996b). On this paper other new species are segregated.

MATERIALS AND METHODS

The new taxa are circumscribed on the basis of material seen at Museo Nacional de Costa Rica (CR), Instituto Politécnico Nacional

(ENCB), Field Museum of Natural History (F), Universidad Nacional Autónoma de México, Ciudad Universitaria (FCME), Harvard University (GH), Instituto de Ecología, A. C. (Sede Regional del Bajío) (IEB), Instituto Nacional de Biodiversidad (INB), Universidad Nacional Autónoma de México, Iztacala (IZTA), Universidad Nacional Autónoma de México de Méjico (MEXU), Missouri Botanical Garden (MO), New York Botanical Garden (NY), Universidad Autónoma Metropolitana, Iztapalapa (UAMIZ), University of California (UC) and Smithsonian Institution (US). The species have been compared with other neotropical treatments and papers as: Mickel 1987, 1991a, 1991b, 1992a, 1992b, 1995, Mickel and Beitel 1988, Rojas 1996a, 1996b, 2002, Smith 1975. The names according with index herbariorum in (Anonymous 2002).

The types that I saw are indicated with admiration marks, the types that I could not see are indicated with -n.s. as abbreviation of not seen. Some herbaria that probably have a specimen cited here but not revised are indicated with interrogation marks.

The countries indicated in bold represent the new distribution no previously reported.

NEW SPECIES

Elaphoglossum angustioblongum A. Rojas, sp. nov. (Fig. 1). Type: PANAMA. Chiriquí: Las Cumbres, hogback ridge N of Quebrada Iglesia, near town of Cerro Punta, 22 July 1971, T. Croat & D. Porter 16078 (Holotype: MO).

Ab E. gomezianum, sed stipitis longioribus, lamina latioribus angustius oblongata, laminae basis obtusa vel rotundata absimilis.

Epiphytic; rhizome 5-8 mm diam, compact; rhizome scales (10-) 15-20 x ca, 1 mm, linear to linear-lanceolate, brown, lustrous, marginally entire; phylloodia 2-5 mm long (few evident by the scales); fronds (30-) 40-65 cm long, 4.0-5.6 cm wide, fasciculate; stipes 1/3-2/5 the frond length, with scales 3-5 mm long, dark brown to blackish, subulate, widely

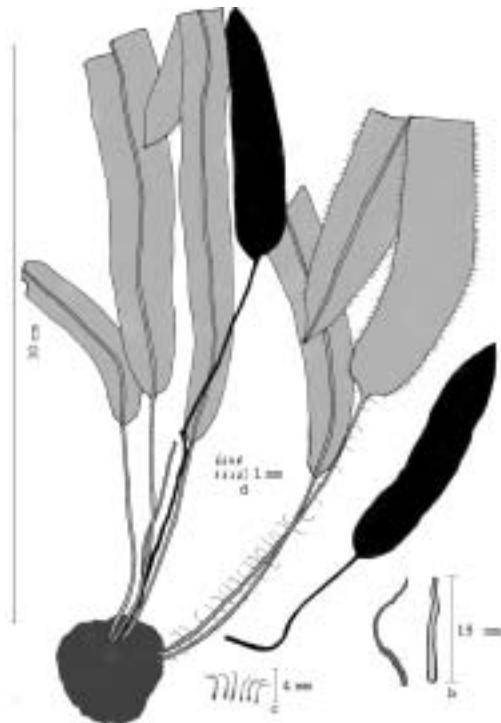

Fig. 1. *Elaphoglossum angustioblongum* (T. Croat & D. Porter 16078): a) Habit. b) Rhizome scale. c) Stipe scale. d) Margin scale.

spreading; blade (20-) 30-45 x 2.5-4.6 cm, narrowly oblong, chartaceous, basically obtuse to rounded, apically acuminate; veins evident, free, simple or once-forked, 1-2 mm apart, at ca. 80° from costa; hydathodes lacking; blade scales 1-2 x 0.2-0.5 mm, subulate, dark brown to black, marginally entire, present only on the margin; fertile fronds 25-40 cm long; stipes 2/3-3/4 the frond length; fertile blades 12-18 x 2.2-3.0 cm, lanceolate, basically obtuse to rounded, apically acute; intersporangial scales absent.

Distribution: Costa Rica and Panama; known only from Cordillera de Talamanca at 1450-2200 m.

Paratypes: COSTA RICA. Puntarenas: foothills of Cordillera de Talamanca, along Río Vella Vista, NW of Las Alturas, ca. 8°57' N, 82°51' W, 1450-1600 m, G. Davidse 24334 (MO). PANAMA. Chiriquí: Bugaba, Cerro Punta, 8°52' N, 82°33' W, 2200 m, H. Werff &

J. Herrera 6271 (MO), from STRI house to edge of mountain across the river, H. Werff & J. Herrera 6303 (MO).

The indument of this species is very similar to that of *E. gomezianum* A. Rojas, but it differs from that species by longer (1/3-2/5 of the frond length vs. 1/6-1/3) stipe, narrower (2.5-4.3 vs. 4.5-5.5 cm) and narrowly oblong (vs. elliptic) blades and obtuse to rounded (vs. cuneate) blade base. The name of this species refers to blade shape.

Elaphoglossum baquianorum A. Rojas, sp. nov. (Fig. 2). Type: COSTA RICA. Limón-/Puntarenas: Talamanca/Coto Brus, Parque Internacional La Amistad, Cordillera de Talamanca, sendero a Cerro Kámuk, entre Cerro Kasir y Cerro Nai, 9° 11' 50" N, 83° 3' 30" W, 2940-3100 m, 8 November 1996, A. Rojas et al. 3208 (Holotype: INB; Isotypes: CR, MEXU, MO, NY, UC, US).

Ab E. erinaceo lamina minori lanceolata, basin obtusa ad truncata, necnon costa nudis diversum.

Epiphytic; rhizome compact, 3-8 mm diam.; rhizome scales 5-12 x 0.5-0.8 mm, linear, brown to atropurpureous, marginally entire; phyllospodia 5-12 mm; fronds (15-) 20-42 cm long; stipes 2/5-3/5 the frond length; stipe scales 2-4 x ca. 0.2 mm, linear-lanceolate to subulate, dark-brown, dispersed, marginally entire; blades 9-22 x 3.0-5.8 cm, chartaceous, lanceolate to oblong-elliptic, basically obtuse to truncate, apically acuminate to cuspidate; blade scales 0.7-1.2 x 0.1-0.3 mm, linear to subulate, dark-brown, dispersed, marginally entire, only on blade margin; veins evident, 1-2-forked, 1-1.5 mm apart, diverging at 65-75° from costa; hydathodes absent; fertile fronds 17-28 cm long; stipes 3/5-3/4 the frond length; fertile blades 4.5-10.5 x 1.3-2.8 cm, lanceolate, basically obtuse to truncate, apically acute; intersporangial scales absent.

Distribution: Mexico, Guatemala, Honduras, El Salvador, Costa Rica and Panama; known from Eje Neovolcánico, Sierra de Juárez, Sierra Norte de Chiapas, Sierra de Chia-

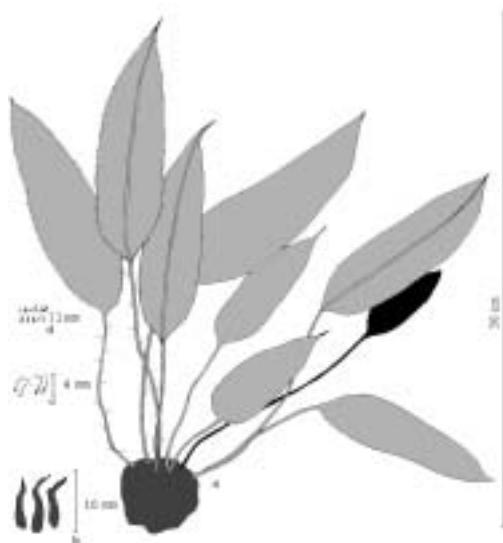

Fig. 2. *Elaphoglossum baquianorum* (A. Rojas et al. 3208): a) Habit. b) Rhizome scale. c) Stipe scale. d) Margin scale.

pas, Montañas de Celaque, Montañas de Santa Ana and Cordillera de Talamanca at 2000-3300 m.

Paratypes: MEXICO. Chiapas: Mpio. Tenejapa, near Paraje Banadil, 2713 m, D. Breedlove 53379 (NY); Mpio. Motozintla de Mendoza, near summit of Cerro Mozotal, 2750 m, D. Breedlove & B. Bartholomew 55847 (MEXU); Mpio. Motozintla de Mendoza, N and W slope of Cerro Mozotal below the microwave tower along the road from Huixtla to El Porvenir and Siltepec, 3000 m, D. Breedlove & A. Rojas et al.*

3208 (CR, INB, MEXU, MO, NY, UC, US). **Cartago/San José:** along Río Tiribí, upstream from Planta Eléctrica María del Rosario (SW of Rancho Redondo), 9°57' N, 83°57.5' W, 1800-1900 m, M. Grayum & G. Stiles 5294 (MO). Paraíso/Pérez Zeledón, Carretera Inte- ramericana, entre Cerro Estaquero y la entrada a las torres, 9°33'35" N, 83°45'25" W, 3100-3300 m, A. Rojas 4525 (CR, INB). PANAMA. **Chiriquí:** Potrero Muleto to summit, Volcán de Chiriquí, 3100-4000 m, R. Woodson & Schery 355 (MO).

Elaphoglossum baquianorum resembles *E. tambillense* (Hook.) T. Moore in form of the blades, with the scales only on the costa and margin, but differs in its thicker rhizome (0.5-0.8 mm diam. vs. 0.3-0.5 cm), longer rhizome scales (5-10 x 0.5-0.8 mm vs. 4-7 x 0.2-0.5 mm), longer fronds [the sterile (15-) 20-45 cm vs. 15-25 cm, and the fertile 17-28 cm vs. 5-10 cm], bigger fertile blade (4.5-10.5 x 1.3-2.8 cm vs. 2.5-3.5 x 1.2-1.5 cm), hydathodes absent (vs. present), and scaly blade margin (vs. no scaly). The shape of the blades of *E. baquianorum* is similar to that of *E. pallidum* (Baker ex Jenman) C. Chr., but the rhizome scales are plane and yellowish (vs. twisted and blackish), with shorter blade (3.0-3.8 vs. 4.3-6.4 times longer than wide), and scaly blade margin (vs. no scaly). Also is similar to *E. erinaceum* in blade shape, but differs in narrow (0.5-0.8 mm 1.0-2.5 mm) and brown to blackish (vs. yellow to orange) rhizome scales, more dense stipe scales, larger [9-22 x 3.0-5.8 cm vs. (14-) 20-40 (-65) x (4-) 5-9 (-11.5) cm] blade, smaller [0.7-1.2 x 0.1-0.3 mm vs. 2-6 x 0.2-0.6 (-1) mm] and present only in margin (vs. costa and margin) blade scales.

This species is dedicated to park rangers Bernardo Picado and Errol Morales, to trail-blazers (“baqueanos”) Freddy Acuña, Eduardo Alfaro, Rodrigo Mora and Juan Solano, and to engineer Ricardo Segura from La Amistad International Park.

***Elaphoglossum cotoi* A. Rojas, sp. nov.** (Fig. 3). Type: COSTA RICA. **San José:** Dota, Cordillera de Talamanca, San Gerardo de Dota, Finca de la Familia Víquez, 9°32'50" N, 83°49'50" W, 2300-2400 m, 17 July 1996, A. Rojas & M. Coto 2790 (Holotype: INB; Isotypes: CR, MO, NY, UC).

Ab E. erinaceo incola terrestri, lamina lanceolata, basi rotunda ad truncata, squamis rhizomatis pallido-pardalis, necnon costa nudis absimilis.

Terrestrial; rhizome 6-12 mm diam, compact; rhizome scales 10-15 x 0.7-1.5 mm, linear to linear-lanceolate, pale brown, flaccid, marginally entire to occasionally dentate; phyllodia 10-17 mm long; fronds 33-83 cm long; stipes 1/3-1/2 the frond length; stipe scales 2-5 x 0.2-0.4 mm, subulate, pale brown on

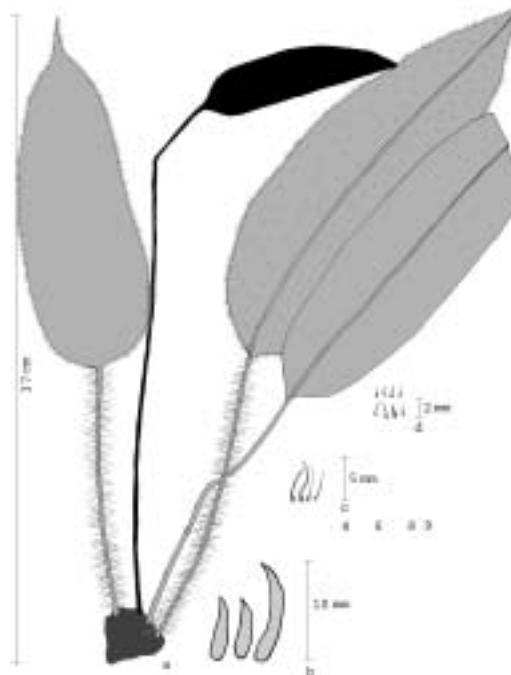

Fig. 3. *Elaphoglossum cotoi* (A. Rojas & M. Coto 2790): a) Habit. b) Rhizome scale. c) Stipe scale. d) Margin scale.

the base, the others brown, dense, marginally entire, mixed with glandular hairs less than 0.2 mm long; blades 20-49 x 6.3-10.3 cm, subcoriaceous, lanceolate to oblong-lanceolate, basically broadly cuneate to rounded, apically acuminate to cuspidate; costa glabrous to dispersedly scaly only on base, the scales similar to those of the stipe scales; marginal scales 1.0-2.5 x 0.2-0.5 mm, linear-lanceolate to subulate, pale brown to brown, dense, marginally entire; abaxial blade surface glabrous or occasionally with stellate hairs 0.1-0.3 mm long, pale to dark brown, dispersed; veins evident, simple to 2-forked, 1-1.5 mm apart, diverging at 65-80° from costa; hydathodes absent; fertile fronds 42-57 cm long; stipes 1/2-3/4 the frond length; fertile blades 12-22 x 2.8-5.2 cm, lanceolate to oblong-lanceolate, basically broadly cuneate to obtuse, apically acute to acuminate; intersporangial scales absent.

Distribution: Costa Rica and Panama; known only from Cordillera de Talamanca at (1700-) 2000-3000 (-3300) m.

Paratypes: COSTA RICA. Estrella-Santa María road, 7000 ft., *H. Stork* 1521 (UC).

Puntarenas: Buenos Aires, Ujarrás, estribaciones del Cerro Amú, Macizo Dúrika, 9°21'10" N, 83°17'30" W, 2500 m, *A. Chacón* 478 (CR, MO, UC). **San José:** Cantón de Pérez Zeledón, Parque Nacional Chirripó, Cuenca Térraba-Sierpe, Llano Bonito, 9°26'58" N, 83°31'25" W, 3200 m, *R. Aguilar* 5076 (INB);

COSTA RICA/PANAMA.

Puntarenas/Chiriquí: Coto Brus, Parque Internacional La Amistad, Cordillera de Talamanca, sendero entre Mellizas y Cerro Quijada del Diablo, linea divisoria, 8°54'25" N, 82°44'55" W, 1700-2130 m, *A. Rojas et al.* 3286 (INB, MO).

Elaphoglossum cotoi resembles *E. erinaceum* in having orange rhizome scales and blackish brown stipes and blade scales, but it differs in its terrestrial (vs. epiphytic) habitat, pale brown (vs. orange-yellowish) rhizome scales, lanceolate (vs. elliptic) blades, basically rounded to truncate (vs. cuneate to obtuse) and glabrous (vs. scaly) costa.

C. V. Morton 5524 identified as *Elaphoglossum christii* H. Chr. (unpublished) is

probably *E. cotoi*, but I did not see the holotype, only a photograph.

This species is dedicated to M. Sc. Mateo Coto Rutherford, North American ecologist, and co-collector of the type material.

Elaphoglossum jinoteganum A. Rojas, sp. nov. (Fig. 4). Type: NICARAGUA. Jinote-ga: along Hwy 3, ca 1 km NW of La Fundadora entrance, unnamed peak ca. 500 m W of Hwy, 13° 01' N, 85° 56' W, 1450-1520 m, 24 May 1981, W. Stevens et al. 20411 (Holotype: CR; Isotype: MO).

Ab *E. erinaceo* lamina linear-elliptica, squamis rhizomatis longioribus, iis stipitis la-minaeque margine sparcis, necnon costa nudis ad sparse squamosa diversum.

Epiphytic; rhizome 3-5 mm diam, compact; rhizome scales (8-) 12-22 x 0.5-1.0 mm, linear-lanceolate, orange-yellowish to orange-reddish, marginally entire; phylloodia 5-10 mm long (not visible for the scales); fronds 17-45 cm long; stipes 1/5-1/4 the frond length; stipe scales 1.0-3.5 x 0.2-0.4 mm, subulate, dark brown to blackish, very dispersed, marginally entire; blades 14-30 x 3.0-5.2 cm, narrowly elliptic to oblong-elliptic, basically cuneate, apically acuminate; costal glabrous to dispersely scaly only on the base, similar to stipe scales; marginal scales 1.0-1.5 x 0.2-0.4 mm, linear-lanceolate to subulate, dark brown to blackish, dispersed, marginally entire; abaxial blade surfaces glabrous; veins evident, simple or 1-forked, 1.0-1.5 mm apart, diverging at 70-80° from costa; hydathodes absent; fertile fronds 26 cm long; stipes ca. 1/2 the frond length; fertile blades 12 x 2.2 cm, oblong-elliptic, basically cuneate to obtuse, apically acute to obtuse; intersporangial scales absent.

Distribution: Nicaragua; known only from Cordillera Isabela at 1450-1600 m.

Paratype: NICARAGUA. Estelí: Cerro Quiabú, situado a unos 8 km NO de la ciudad de Estelí, 1500-1600 m, A. Grijalva & M. Araquistain 618 (CR).

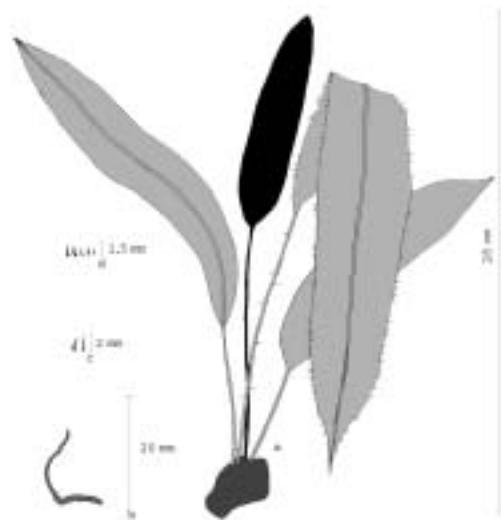

Fig. 4. *Elaphoglossum jinoteganum* (Stevens et al. 20411):
a) Habit. b) Rhizome scale. c) Stipe scale. d) Margin scale.

Elaphoglossum jinoteganum resembles *E. erinaceum* in having pale rhizome scales and blackish stipe and blade scales, but differs in its narrower and longer rhizome scales [(8-) 12-22 x 0.5-1 mm vs. 6-12 (-15) x 1.0-2.5 mm], orange-yellowish to orange-reddish (vs. pale brown-yellowish to orange-yellowish); shorter stipes of the sterile blades (1/5-1/3 vs. 1/3-1/2) narrowly elliptic to oblong-elliptic (vs. elliptic to broadly elliptic), 3-5.2 cm vs. (4-) 5-11 cm wide, glabrous to very sparsely scaly (vs. scaly) on costa; stipe and blade margin dispersely scaly (vs. densely scaly), smaller scales (stipe scales 1.0-3.5 mm vs. 3-8 mm, blade margin scales 1-1.5 mm vs. 1.5-3.0 mm). The blades shape and size recall *E. mexicanum* (Liebm.) A. Rojas, but the rhizome scales are orange-yellowish to orange-reddish (vs. pale to dark brown), and the costa is glabrous and dispersely scaly on the stipe and margin (vs. costa, stipe and margin densely scaly); smaller scales (costa and stipe scales 1-3.5 mm vs. 3-5 mm, blade margin scales 1.0-1.5 mm vs. 1.5-3 mm).

The name of this species refers to the type locality.

Elaphoglossum neeanum A. Rojas, sp. nov. (Fig. 5). **Type:** PANAMA. Darién: Middle slopes on W side of Cerro Pirre, 7°56' N, 77°45' W, 800-1050 m, T. Croat 68931 (Holotype: MO).

Ab E. cincto rhizomate repens, rhizomatis squamis fuscus et lamina latiori differt.

Epiphytic; rhizome 4-7 mm diam., short creeping, dorsiventral; rhizome scales 7-15 x 0.3-1.0 mm, linear to linear-lanceolate, pale-brown to atropurpureous, marginally entire to occasionally dentate; phyllopodia 2-6 mm (not visible for the scales); fronds 23-52 cm long; stipes 2/5-1/2 the frond length; stipe scales 1.5-4.0 x ca. 0.1-0.2 mm, linear to subulate, dark brown, dispersed, marginally entire; blades 14-31 x 3.1-5.4 cm, narrowly elliptic to oblong-elliptic, subcoriaceous, basically cuneate, apically acute to cuspidate; blade scales 1-2 x 0.1-0.3 mm, linear to subulate, dark brown to atropurpureous, marginally entire, only on blade margin and rarely on base of costa, dispersed or absent; few evident veins, simple or 1-forked, 1-2 mm apart, diverging at 60-75° from costa; hydathodes absent; fertile fronds 30-45 cm long; stipes 3/5-4/5 the frond length; fertile blades 10.5-17 x 2.6-3.2 cm, lanceolate to elliptic, basically cuneate to obtuse, apically acute to acuminate; interporangial scales absent.

Distribution: Panama and Colombia; known from Serranía del Darién and Cordillera de Los Andes at 800-1850 m.

Paratypes: COLOMBIA. Antioquia: Guatapé, Vereda Santa Rita, ca. 1850 m, L. Atehortua 1169 (MO); Urrao, Las Orquídeas, Vereda Calles, Parque Nacional Natural Las Orquídeas, Quebrada Honda, al NW de la Caña Calles, 6°29' N, 76°14' W, 1330m, J. P. poly et al. 16855 (MO).

Elaphoglossum neeanum resembles *E. cinctum* Rosenst. in blade shape and size, but differs in short-creeping (vs. compact) rhizome and brown (vs. yellowish) rhizome scales and broader [3.1-5.4 cm vs. 1.7-3 (-3.5) cm] blade. Also is very similar to *E. albomarginatum* A. R. Sm. by the brown rhizome scales and glabrous blade, but the rhizome is short-creeping (vs. compact) and dorsiventral (vs. radial), the

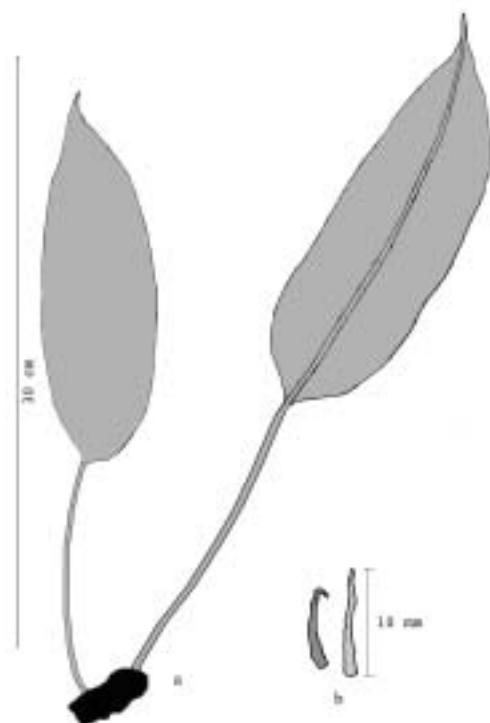

Fig. 5. *Elaphoglossum neeanum* (T. Croat 68931): a) Habit. b) Rhizome scale.

rhizome scales are longer and narrower (7-15 x 0.3-1.0 mm vs. 7-10 x 1-2 mm) and has green blade margin (vs. yellowish to whitish).

The specific epithet is in honor to Dr. Michael Nee of New York Botanical Garden, for the many interesting collections in ferns.

Elaphoglossum silencioanum A. Rojas, sp. nov. (Fig. 6). Type: COSTA RICA. Limón-/Puntarenas: Talamanca/Coto Brus, Parque Internacional La Amistad, Cordillera de Talamanca, Valle del Silencio, entre sitio de acampar y Casacoca, 9°07'15" N, 82°57'55" W, 1700-2500 m, 14 April 1996, F. Quesada et al. 1421 (Holotype: INB; Isotypes: CR, MO, NY).

Ab E. erinaceo statuta minori, stipite longiori, lamina minori, squamis rhizomatis angustioribus, necnon costa glabrous absimilis.

Epiphytic; rhizome compact, 4-7 mm diam.; rhizome scales 7-15 x 0.3-1.0 mm,

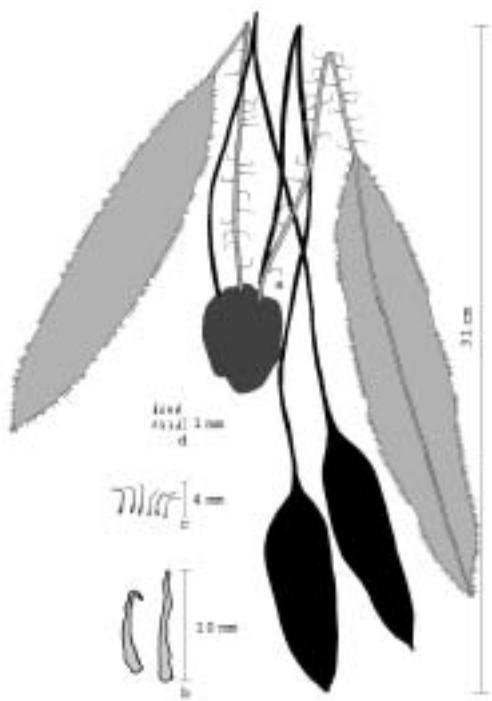

Fig. 6. *Elaphoglossum silencioanum* (Fco. Quesada et al. 1421): a) Habit. b) Rhizome scale. c) Stipe scale. d) Margin scale.

linear to linear-lanceolate, pale-brown to atropurpureous, marginally entire to occasionally dentate; phylloodia 2-6 mm (not visible for the scales); fronds 23-52 cm long; stipes 2/5-1/2 the frond length; stipe scales 1.5-4.0 x ca. 0.1-0.2 mm, linear to subulate, dark brown, dispersed, marginally entire; blades 14-31 x 3.1-5.4 cm, subcoriaceous, narrowly elliptic to oblong-elliptic, basically cuneate, apically acute to cuspidate; blade scales 1-2 x 0.1-0.3 mm, linear to subulate, dark brown to atropurpureous, dense, marginally entire, only on blade margin and rarely on base of costa, dispersed; few evident veins, simple or 1-forked, 1-2 mm apart, diverging at 60-75° from costa; hydathodes absent; fertile fronds 30-45 cm long; stipes 3/5-4/5 the frond length; fertile blades 10.5-17 x 2.6-3.2 cm, lanceolate to elliptic, basically cuneate to obtuse, apically acute to acuminate; interporangial scales absent.

Distribution: Costa Rica and Panama; present only in Valle del Silencio and Fortuna Lake at (1100-) 2300-2500 m.

Paratypes: COSTA RICA. **Limón:** Talamanca, Cordillera de Talamanca, Atlantic slope, along the Río Terbi, 0.5-1.5 airline km W of the Costa Rican-Panamanian border, 2300-2400 m, 98°8' N, 82°57' W, G. Davidse et al. 28731 (CR, MO); Cordillera de Talamanca, Atlantic slope, Cerros Tararia (locally known as Tres Picos), 9°09' N, 82°58' W, 2400-2600 m, G. Davidse et al. 28795 (MO); south side of unnamed cordillera between the Río Terbi and Río Siní, 2-4 airline km W of the Costa Rican-Panamanian border, 9°09'-9°11' N, 82°57'-82°58' W, G. Davidse et al. 28940 (CR, MO); Parque Internacional La Amistad, Valle del Silencio, sobre sendero, 9°07'15" N, 82°57'55" W, 2450 m, M. Moraga et al. 327 (CR, INB, MO, NY). **San José:** Cerro Chirripó, lower SW slopes along trail from Canaán to summit, 5500-7000 ft., A. Evans et al. 40 (US). PANAMA. **Chiriquí:** Along road between Fortuna Lake and Chiriquí Grande, 4.5-5 km N of dam over Fortuna Lake, 8°43' N, 82°17' W, 1100-1135 m, T. Croat & M. Grzym 59970 (MO, UC).

Elaphoglossum silencioanum resembles *E. erinaceum* in blade shape and stipe length, but differs in its narrower (0.3-1 mm vs. 1-2.5 mm), brown-yellowish to dark brown (vs. pale brown-yellowish to orange-yellowish) rhizome scales, relatively longer stipes (2/5-1/2 vs. 1/3-2/5 of the frond length), narrowly elliptic to oblong-elliptic (vs. elliptic to broadly elliptic) and smaller [14-31 x 3.1-5.4 cm vs. (14) 20-40 (65) x (4) 5-9 (11.5) cm] blades, glabrous (vs. scaly) costae and higher elevation habitat [2300-2500 m vs. 700-2000 (2600) m]. The blades and stipe size recalls *E. baquianum*, but *E. silencioanum* differs in its narrowly elliptic to oblong-elliptic (vs. lanceolate to oblong-elliptic), subcoriaceous (vs. chartaceous) blades basically cuneate (vs. obtuse to truncate), and blade margin scales dense (vs. dispersed).

The name of this species refers to the type locality.

NEW COMBINATION
WITH RANGE EXTENSION

Elaphoglossum mexicanum (E. Fourn.) A. Rojas, comb. nov. (Fig. 7). *Acrostichum mexicanum* E. Fourn., Mexic. Pl. 1: 63-64. 1872. Type: MEXICO. Puebla: Teziutlán, Barranca de Chinantla, 6500-7000 ft., F. Liebmann s.n. (Holotype: P!; Isotype: K-n.s.).

Acrostichum hybridum Liebm. 167. non Bory.

Distribution: Previously known only from Mexico, but now also from **Guatemala, Honduras and El Salvador**. This is present in Sierra Madre Oriental, Sierra de Juárez, Sierra de Chiapas, Celaque Mountains and Santa Ana Mountains at 1170-2713 m.

Material of new distribution: GUATEMALA. **Quiché:** mountain slopes S of Nebaj, 6500-7500 ft., G. Proctor 25073 (US). **San Marcos:** Finca El Porvenir along Río Chopal, S facing slopes of Volcán Tajumulco, 1300-1500 m, J. Steyermark 37486 (F); near Aldea Fraternidad, between San Rafael Pie de La Cuesta and Palo Gordo, W facing slope of the Sierra Madre Mountains, 1800-2400 m, L. Williams et al. 26212 (F). **El Progreso:** hills N of Finca Piamonte, between Finca Piamonte and summit of Volcán Santa Luisa, 2400-3333 m, J. Steyermark 43585A (F). HONDURAS. **El Paraíso:** Quebrada Tapahuasca, 1300 m, A. Molina 14654 (F, NY). **Francisco Morazán:** San Juancito Mountains, above San Juancito, 2000 m, L. Williams 17560 (US). **Lempira:** Montaña de Celaque, SE part of Massif, along represa trail from Gracias to top of mountain, 14°33' N, 88°39' W, 1850 m, G. Davidse & R. Zuñiga 34639 (MO, TEFH); Celaque National Park, trail from Camp 1 to Río Naranjal, 14°33' N, 88°40' W, 2000 m, R. Moran 5547 (F, MO, NY, UC). **Santa Bárbara:** 7 km N of El Mochito, on th slopes of Mountainins Santa Bárbara, 14°55' N, 88°07' W, 2200-2500 m, R. Moran 5689 (MO). EL SALVADOR. **Santa Ana:** in Zamorano Muster aus Mexiko ortsan-gabe vorhanden, W. Lötschert 369 (US); Bosque Montecristo, 2300 m, R. Seiler 130 (F).

This species is similar to *E. barbatum* (H. Karst.) Hieron. by the black and dense stipe

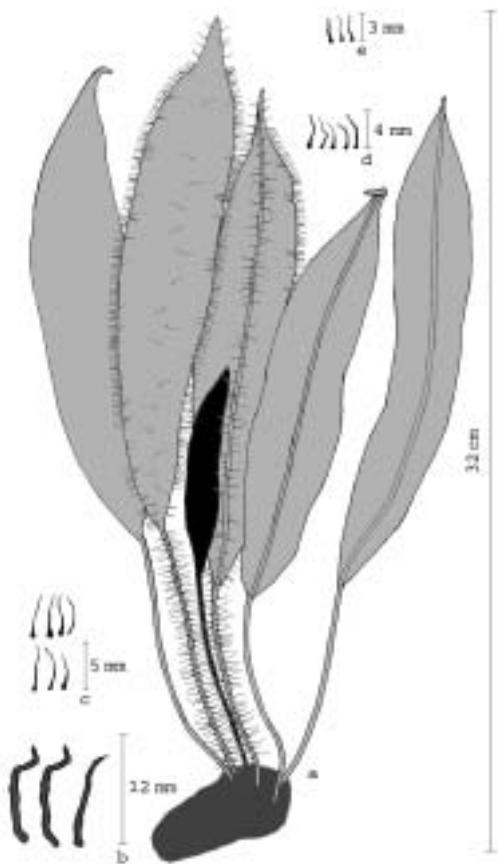

Fig. 7. *Elaphoglossum mexicanum* (R. Riba et al. 334): a) Habit. b) Rhizome scale. c) Stipe and costal scale. d) Margin scale.

and blade scales, but differs in smaller fronds (22-40 cm long vs. 35-63 cm) frond size, elliptic (vs. oblong) blades, cuneate (vs. obtuse to rounded) blade base, and glabrous (vs. scaly) abaxial blade surface.

NEW RECORDS

Elaphoglossum barbatum (H. Karst.) Hieron., Bot. Jahrb. Syst. 34: 553. 1904. *Acrostichum barbatum* H. Karst., Fl. Columb. 2: 155. t. 181. 1869. Type: Colombia, Bogotá, Lindig 111 (no localized)

Distribution: Previously known from Colombia, Ecuador and Peru, but now also from

Mexico, Guatemala and Costa Rica (probably also in Panama). This is present in Sierra de Juárez, Sierra Madre de Chiapas, Cordillera de Talamanca and Cordillera de Los Andes at 2200-2900 (-3300) m.

Material of new distribution: MEXICO.
Oaxaca: along road from Teotitlán del Camino to Huautla de Jiménez, 16.7-18.2 mi by road above Teotitlán del Camino, 2250-2300 m, W. Anderson & C. Anderson 4728 (ENCB, IEB, NY); Teotitlán, 26-29 km NE of Teotitlán del camino, vicinity of pass at Puerto Soledad, 7000-7400 ft., J. Mickel & R. Hellwig 4119 (NY); Dist. Mixes, SE shoulder of Cerro Zempoaltepetl, below Patio de Arena, 8200 ft., J. Mickel & S. Leonard 4904 (NY); Santiago Zatapec, Sierra de Juárez, al costado N de Cerro Zempoaltepetl, orilla de quebrada, 17°12'38" N, 96°00'50" W, 2210 m, A. Rojas et al. 4444 (INB, MEXU, NY, UAMIZ). GUATEMALA. **Quezaltenango:** Fuentes Georginas, western slope of Volcán de Zunil, about 2850 m, P. Standley 67451 (US). COSTA RICA. **Cartago:** Paraíso, investigation area of the CATIE, 9°33'30" N, 83°41'30" W, 2600-2700 m, J. Bittner 161 (CR, MO, NY); Villa Mills (pilot area CATIE project), 2700 m, Y. Widmer 28 (NY). **Limón/Puntarenas:** Talamanca/Coto Brus, Parque Internacional La Amistad, Cordillera de Talamanca, sendero a Cerro Kámuk, entre Cerro Kasir y Cerro Nai, 9°11'50" N, 83°3'30" W, 2940-3100 m, A. Rojas et al. 3203 (CR, INB, MO, NY, UC, US); entre Cerro Nai y Cerro Dudu, 9°13'05" N, 83°4'30" W, 2750-3100 m, A. Rojas et al. 3231 (CR, INB, MO, NY). **San José:** Pérez Zeledón, Parque Nacional Chirripó, Cordillera de Talamanca, sendero entre Llano Bonito y Monte sin Fé, 9°26'55" N, 83°32'05" W, 2600-2900 m, A. Rojas et al. 2834 (INB, NY); Pérez Zeledón, Parque Nacional Chirripó, Cordillera de Talamanca, Monte sin Fé, 9°27'05" N, 83°31'25" W, 2900-3300 m, A. Rojas 2856 (CR, INB, NY).

Elaphoglossum barbatum resembles *E. erinaceum* in having pale brown-yellowish rhizome scales and blackish brown stipe and blade scales, but differs in its linear-lanceolate

blades (vs. elliptic or oblong-elliptic) basically obtuse to truncate (vs. cuneate to obtuse) and scaly on abaxial blade surface (vs. mostly glabrous, scaly only on costa and margin).

Elaphoglossum scolopendrifolium (Raddi) J. Sm. Bot. Mag. 72: 17. 1846. *Acrostichum scolopendrifolium* Raddi, Critt. Bras. 1.4, t. 16. 1825. Type: Brazil, Rio de Janeiro, Raddi s.n. (Holotype: PI-n.s.).

Acrostichum nitidum Liebm., Kongel. Danske Vidensk. Selsk. Skr., Naturvidensk. Math. Afd., Ser. 5, 1: 168. 1849. Type: Mexico, Puebla, Chinautla, Barranca, 7000 ft., Liebmann [Mex. Pl. 2421] (Holotype: C-n.s.; Isotype: P!). Nomen novum: *Elaphoglossum fimbriatum* T. Moore, Index Fil. 356. 1862. *Elaphoglossum hybridum* var. *nitidum* (Liebm.) H. Christ, Primitiae Florae Costaricensis 3: 7. 1901.

Distribution: Previously known only from Brazil, but now also from Mexico. Present in Sierra Madre Occidental, Sierra de Manantlán, Eje Neovolcánico, Sierra Madre Oriental, and Atlantic slope of Altiplanicie del Brasil at (350-) 1500-2600 m.

Material of new distribution: MEXICO.

Cuernavaca: Barranca de Chalchihuapan, al NE de Tetela del Monte, 1800 m, B. Pérez et al. 793 (IEB). **Guerrero:** N slope of Cerro Alquitrán, 10-14 km by road W of México, highway 95 and Mazatlán, 2250-2450 m, W. Anderson & Laskowski 4449 (ENCB); Mpio. Milantepec, aprox. 3 km al S de Paraje Montero, ladera N del Cerro Tlalitzahuac, 2150 m, F. Lorea 1916 (FCME); Mpio. Tlacotepec, 9 km al S de Verba Santa, F. Lorea 2225 (FCME, IEB); Mpio. Atoyac de Alvarez, 2 km sobre la desv. a El Iris, camino que va de Puerto del Gallo a Atoyac, 2200 m, F. Lorea 2320 (FCME); Cerro El Huisteco, 4 km al N de Taxco, 2480 m, F. Lorea 3324 (FCME, IEB); Mpio. Taxco, aprox. 2 km al SO de San Juan Tenerias, camino a Puerto Oscuro, 2300 m, F. Lorea 3380 (FCME, IEB); Mpio. Atoya de Alvarez, 2100 m, F. Lorea 3992 (FCME, IEB); Cerro El Huisteco, 4 km al N de Taxco, 2380 m, F. Lorea 4482 (FCME, IEB, MEXU); Chilpancingo, Cerro Alquitrán, cerca de Mazatlán, 2450 m, J. Rzedowski 23682 (ENCB).

NY); Cruz del Rosario, 7 km al NW de taxco, sobre el camino a Tetipac, 2250 m, *J. Rzedowski 26011* (ENCB, NY). **Jalisco:** Sierra de Manantlán, dirt road a Durazno, S slope, 6000 ft., *Boutin & Brandt 2570* (MEXU, NY); 10-12 mi. S of Talpa de Allende, in the head waters of an E branch of Río de Talpa, 3 mi. above Los Sauces, 1400 m, *R. McVaugh 21439* (NY); Sierra de Manantlán, (30-35 km SE of Autlán), 1-4 km below of summit called “La Cumbre”, near the lumber-road between El Chante and Cuzalapa, and above the abandoned site of Durazno, 19°32' N, 104°14' W, 1500-1900 m, *R. Pérez et al. 793* (MEXU, UAMIZ), *B. Pérez et al. 796* (UAMIZ), *B. Pérez et al. 806* (UAMIZ); Barranca above Cuernavaca, 6500 ft., *C. Pringle 6546* (MO, NY, UAMIZ); Mountain canyon above Cuernavaca, 6500 ft., *C. Pringle 15713* (MO); Tlalnepantla, “Xalpa”, a 1 km de la secundaria de Tlalnepantla, 19°1' N, 99°00' W, 2080 m, *Y. Sandoval et al. 71* (IEB, MEXU). **Sinaloa:** Sierra Madre Occidental, Barranca Rancho Liebre, 1 mi. S of El Palmito on Hwy. 40 and 1 mi. W of the Hwy., 6900 ft., *A. Sanders et al. 4409* (NY); Concordia, El Palmito y alrededores, 2000 m, *R. Vega et al. 3131* (ENCB).

Elaphoglossum scolopendrifolium resembles *E. erinaceum* in having pale rhizome scales and similar frond size, but differs in its narrower (0.5-1 mm vs. 1-2.5 mm), orange-yellowish to orange-reddish (vs. pale brown-yellowish to orange-yellowish) rhizome scales, brown-yellowish to brown (vs. dark brown-reddish to blackish) stipe and blade scales, oblong-lanceolate to oblong-elliptic (vs. elliptic to broadly elliptic) and narrower [(3.2) 4-5.3 cm vs. (4) 5-11.5 cm] blades. The blade shape and size recalls *E. jinoteganum*, but *E. scolopendrifolium* has shorter rhizome scales [5-10 mm vs. (8-) 12-22 mm], longer stipes [(1/3-) 2/5-1/2 vs. 1/5-1/3], scaly (vs. glabrous) costal, brown-yellowish to brown (vs. dark brown-reddish to blackish) stipe and blade margin scales, and longer (3-5 x 0.3-0.8 mm vs. 1-3.5 x 0.2-0.4 mm) stipe scales.

This name was been utilized by C. Pringle between 1986-1900 as determined him in *C. Pringle 6546* (GH) and *C. Pringle 15713* (GH), but he don't made an official publication.

REDEFINED CONCEPT

Elaphoglossum erinaceum (Fée) T. Moore, Index Fil. 9. 1857. *Acrostichum erinaceum* Fée, Mém. Foug. 2: 41. 1845. Type: Guadeloupe. Riviè-re de Saint-Louis, *Thiouville s. n.* (Syntype: P-n.s.).

Distribution: Mexico, Central America, Colombia, Venezuela, Ecuador, Peru, Bolivia, Brazil and Antilles, in all wet mountains at (300-) 800-2000 (-2800) m.

Many plants of the Sect. *Polytrichia* Sub-sect. *Hybrida* has been identified as *E. erinaceum* (sensu lato), but this species is characterized by epiphytic habit (rarely terrestrial) and the combination of broad, yellow light and flaccid rhizome scales, oblong blade and black stipe and blade scales. In Mexico and Central America the typical rhizome scales of *E. erinaceum* is also present in *E. cotoi* and *E. barbatum*, but the second species have lanceolate blade, brown stipe and blade scales and terrestrial habit, while the third have scales on abaxial blade (vs. only on costa and margin) and terrestrial habit. For determinate the other species see the key. The typical altitudinal distribution of this species is 800-2000 m, but in the mountains of Costa Rica and Panama a variant with blade scales similar to *E. silencioanum* is present in higher elevation.

Elaphoglossum tambillense (Hook.) T. Moore, Index Fil. 15. 1857. *Acrostichum tambillense* Hook., Icon. pl. 7: t. 656. 1844. Type: Ecuador, Tambillo, *Jameson s. n.* (Holotype: K-n.s.; Isotype: P!).

Distribution: Mexico, Guatemala, Colombia, Venezuela Ecuador and Peru; present in Sierra Madre de Chiapas and Cordillera de Los Andes at 2500-3000 m.

Previous reports of this species from Costa Rica and Panama (Mickel 1988, 1995), probably represent *E. baquianorum*, because according with all the material revised from Costa Rica and Panama of related species none correspond with *E. tambillense*.

This is the only species of section *Polytrichia* subsection *Hybrida* with hydathodes, and it is easily determinated for this reason.

REJECTED SPECIES

Elaphoglossum pallidum (Baker ex Jenman) C. Chr., Index Filic. 312. 1905. *Acrostichum pallidum* Baker ex Jenman, J. Bot. 17: 263. 1879. Type: Jamaica, *Jenman s. n.* (Holotype: K-n.s.).

Elaphoglossum pallidum is characterized by dark brown rhizome scales, stipes ca. 2/5 of the frond length, blades 4.3-6.4 times longer than wide, narrowly lanceolate to oblong-lanceolate, subcoriaceous blade, glabrous stipe and blade margin, and truncate to cordiform blade base of fertile blades.

In general, all the material with dark brown to atropurpureous rhizome scales has been identified as *E. pallidum*. Nevertheless, the rhizome scale color is variable on various species of subsection *Hybrida*. In other cases, the material with glabrous or very dispersely scaly fronds has been identified as this species. In contrast, *E. baquianorum* (this paper) has blades 3.0-3.8 times longer than wide, chartaceous, lanceolate to oblong-elliptic, basically obtuse to truncate, apically acuminate to cuspidate, dispersely scaly stipe and blade margin, and cuneate to obtuse blade base of fertile blades; *E. gomezianum* A. Rojas (Rojas 1996) has shorter stipes (1/6-1/3 of the frond length), elliptic to widely elliptic blades, and scaly stipes and blade margins; *E. jinoteganum* (this paper) has orange-yellowish to orange-reddish rhizome scales, stipes 1/5-1/3 of the frond length, narrowly elliptic to oblong-elliptic blades, and dispersed scales on the stipes and blade margins; *E. mexicanum* (this paper) has elliptic to linear-elliptic blades, and densely scaly stipes, costal and blade margins.

Distribution: Jamaica and Hispaniola at 1400-1700 m.

Key to Mexican and Central American taxa of *Elaphoglossum* section *Polytrichia*

1. Veins reticulate *E. crinitum* (L.) H. Christ
1. Veins free or joined at the tips to a submarginal vein 2
2. Blade and stipe scales orange-yellowish; blades scaly abaxially 3
2. Blade and stipe glabrous or with dark brown to blackish scales; blades commonly scaly only on costa and margin (if blade and stipe scales are orange-yellowish the blades are scaly only on costa and margin) 5
3. Rhizome scales (12-) 20-30 mm long, orange-reddish; stipes absent to 2 cm long *E. latum* (Mickel) Atehortúa ex Mickel
3. Rhizome scales 7-12 (-15) mm long, orange-yellowish; stipes (2-) 3-18 cm long 4
4. Stipe and costal scales 1-3 mm long *E. auripilum* H. Christ var. *auripilum*
4. Stipe and costal scales 3-7 (-10) mm long *E. auripilum* H. Christ var. *longipilosum* Atehortúa
5. Stipes 1/20-1/12 the frond length *E. backhouseanum* T. Moore
5. Stipes 1/7-1/2 the frond length 6
6. Rhizome scales orange-yellowish, orange-reddish or brown 7
6. Rhizome scales dark brown to blackish 18
7. Blades not scaly (occasionally with stellate hairs) 8
7. Blades scaly, at least dispersely scaly on the margin 10
8. Rhizome short creeping; blade margin green *E. neeanum* A. Rojas
8. Rhizome compact; blade margin yellowish to whitish 9
9. Rhizome scales brown; blades abaxially with stellate hairs *E. albomarginatum* A. R. Sm.
9. Rhizome scales orange-yellowish; blades abaxially glabrous *E. pallidiforme* Mickel
10. Stipes 1/7-1/3 the frond length; blades narrowly elliptic to narrowly oblong 11
10. Stipes 1/3-2/3 the frond length; blades oblong-lanceolate or lanceolate 12
11. Rhizome scales gold to orange-yellowish; costal scales absent; marginal scales dispersed; blades elliptic, basically narrowly cuneate *E. gomezianum* A. Rojas
11. Rhizome scales brown to orange-reddish; costal scales rare to absent; marginal scales abundant; blades narrowly oblong to oblong-elliptic, basically broadly cuneate to obtuse *E. jinoteganum* A. Rojas
12. Blade surface abaxially dispersely scaly *E. barbatum* (H. Karst.) Hieron.
12. Blade surface abaxially glabrous 13
13. Stipe and blade scales brown-yellowish to brown 14
13. Stipe and blade scales dark brown to blackish 15
14. Rhizome scales 10-15 x 0.7-1.5 mm, pale brown, flaccid; blade lanceolate to oblong-lanceolate *E. cotoi* A. Rojas
14. Rhizome scales 5-10 x 0.5-1.0 mm, orange-yellowish to orange-reddish, rigid; blade oblong to oblong-elliptic *E. scolopendrifolium* (Raddi) J. Sm.
15. Sterile blades broadly elliptic to oblong-elliptic; blade scales blackish; costa scaly *E. erinaceum* (Fée) T. Moore
15. Sterile blades lanceolate, oblong-lanceolate or to narrowly oblong; blade scales brown-reddish to dark brown; costa glabrous or scaly only on base 16
15. Stipes 1/3-2/5 the sterile frond length; sterile blades (20-) 30-45 x 2.5-4.6 cm *E. angustioblongum* A. Rojas
15. Stipes 2/5-3/5 the sterile frond length; sterile blades 9-31 x 3.0-5.8 cm 16

- 17. Blades narrowly oblong to linear-elliptic, basically cuneate; blade margin scales dense *E. silencioanum* A. Rojas
- 17. Blades lanceolate to elliptic-lanceolate, basically rounded to truncate; blade margin scales scattered *E. baquianorum* A. Rojas
- 18. Stipes 1/7-1/4 the frond length *E. gomezianum* A. Rojas
- 18. Stipes 2/7-2/3 the frond length 19
- 19. Rhizome scales 0.2-0.4 mm wide; blades glabrous *E. denudatum* (Jenman) Maxon
- 19. Rhizome scales 0.5-1 mm wide; blades scaly (at least along the margin) 20
- 20. Blades lanceolate to elliptic-lanceolate, basically rounded to truncate; blade margin scales scattered *E. baquianorum* A. Rojas
- 20. Blades narrowly elliptic, oblanceolate or linear-elliptic, basically cuneate; blade margin scales dense 21
- 21. Rhizome scales 7-12 mm long, blades narrowly elliptic to oblanceolate, basically attenuate to narrowly cuneate; costae and margins scaly, the scales 2-4 mm long *E. mexicanum* (E. Fourn.) A. Rojas
- 21. Rhizome scales 4-8 mm long; blades narrowly oblong to linear-elliptic, basically cuneate; costae glabrous; blade margins scaly, the scales 1-3 mm long *E. silencioanum* A. Rojas

ACKNOWLEDGMENTS

This work has been possible thanks to the agreement between INBio-SINAC. The following herbaria that loaned specimens (CR, ENCB, F, FCME, GH, INB, IZTA, MEXU, MO, NY, UAMIZ, UC and US), Robbin Moran for comments on the manuscript, Teresa Terrazas for the critical revision, Daniel Tejero and anonymous reviewers for their help, and to all who, in one way or another, made this work possible.

RESUMEN

Seis especies nuevas son descritas: *Elaphoglossum angustioblongum* A. Rojas, *E. baquianorum* A. Rojas, *E. cotoi* A. Rojas, *E. jinoteganum* A. Rojas, *E. neeanum* A. Rojas y *E. silencioanum* A. Rojas. La especie *Elaphoglossum mexicanum* (E. Fourn.) A. Rojas es combinada; las especies *E. barbatum* (H. Karst.) Hieron. y *E. scolopendrifolium* (Raddi) J. Sm. son registradas; además, *E. erinaceum* (Fée) T. Moore y *E. tambillense* (Hook.) T. Moore son redefinidas, y *E. pallidum* (Baker ex Jenman) C. Chr. no se distribuye en México y Centroamérica. De las especies

nuevas sólo *E. neeanum* se encuentra fuera de la región. Se proporciona una clave para reconocer las especies de México y Centro América.
